Guidelines for Identifying Business Risks and Opportunities Arising from Ecosystem Change

Version 2.0
Global warming may dominate headlines today. Ecosystem degradation will do so tomorrow.

The Millennium Ecosystem Assessment—the first global audit of the world’s forests, wetlands, and other ecosystems—found that ecosystems have declined more rapidly and extensively over the past 50 years than at any other comparable time in human history. Left unchecked, this degradation jeopardizes not just the world’s biodiversity, but also its businesses. This is because companies depend on the services healthy ecosystems provide such as freshwater, wood, genetic resources, pollination, climate regulation, and natural hazard protection.

This publication provides corporate managers with a proactive approach to making the connection between ecosystem change and their business goals. It introduces the Corporate Ecosystem Services Review—a structured methodology to help businesses develop strategies for managing risks and opportunities arising from their dependence and impact on ecosystems. It is a tool for corporate strategy development and can augment existing environmental management systems.

Our three organizations contributed complementary skills to create the Ecosystem Services Review. The World Resources Institute developed the methodology and managed the road-testing phase as part of its efforts to mainstream ecosystem services into private sector decision-making. Five member companies of the World Business Council for Sustainable Development—Akzo Nobel, BC Hydro, Mondi, Rio Tinto, and Syngenta—road-tested and provided feedback on the methodology. The Meridian Institute brought the experience and relationships developed as a core member of the secretariat that designed and managed the Millennium Ecosystem Assessment and brought its process design and facilitation skills to the team.

As of early 2012, an estimated 300 companies have used this guidance to identify and address business risks and opportunities arising from ecosystem change. In addition, new decision support tools have been introduced to help companies better understand and capitalize upon the specific business value they receive from ecosystem services, such as the Guide to Corporate Ecosystem Valuation. The Corporate Ecosystem Services Review 2.0 has been updated to draw on these developments.

Global climate change and the demands of a growing population are likely to further degrade ecosystems in coming years, increasingly challenging business assumptions and practices. The Ecosystem Services Review offers a promising approach for companies to manage the risks and opportunities that will emerge and, at the same time, to become better stewards of the environment. Our three organizations are committed to working with the business community to help this approach become standard practice.
The authors gratefully acknowledge John Ehrmann (Meridian Institute), James Griffiths (WBCSD), Mikkel Kallesoe (WBCSD and IUCN), and Heather Lair (Meridian Institute) for their contributions in developing the Corporate Ecosystem Services Review.

We thank Yasmina Abdelilah, Karen Bennett, Alexa Clay, Suzanne Ozment, Brianna Peterson, and Alison Williams of WRI for their research in support of this publication.

We are grateful to the following colleagues and friends who provided critical reviews and other valuable contributions to this publication: Andrew Aulisi (WRI), Manish Bapna (WRI), Nicholas Bertrand (United Nations Environment Programme), Gerard Bos (Holcim), Antonio Neves de Carvalho (Energias de Portugal), Michael Fahy (SGS SA), Sara Carvalho Fernandes (Energias de Portugal), Jessica Fox (EPRI Solutions), Trey Gibbs (ERS Global, Inc.), Eva Zabey (WBCSD), Frances Irwin (WRI), Joshua Kahan (ERS Global, Inc.), Bruce M. Kahn (Citi Smith Barney), Ayako Kohno (Hitachi Chemical Co., Ltd.), Robin Murphy (WRI), Liv Marthe Ness (Det Norske Veritas), Chris Perceval (WRI), Noam Ross (GreenOrder), Theo Stephens (Department of Conservation, Government of New Zealand), Kerry ten Kate (Forest Trends), Tor G. Tollefsen (Det Norske Veritas), Sissel Waage (Business for Social Responsibility), and Fred Wellington (WRI).

The authors extend special gratitude to the ESR road-test companies, including Karin Andersson (Akzo Nobel), Chris Burchmore (Mondi), Doug Burden (Mondi Shanduka), Peter Gardiner (Mondi), Juan Gonzalez-Valero (Syngenta), Klas Hallberg (Akzo Nobel), Steve Hunt (Akzo Nobel), Hans Johansson (Akzo Nobel), Sawatenter Khosla (Syngenta), Cameron Jones (Rio Tinto), Tim Lesiuk (BC Hydro), Mick Lovely (Rio Tinto), Dave Richards (Rio Tinto), Bruce Sampson (BC Hydro), Erik Widén (Akzo Nobel), Ian Wylie (Rio Tinto), and Douglas van Zyl (Mondi).

The publication process was helped along by WRI’s wonderful publications team, particularly Hyacinth Billings and Jennie Hommel. We thank Bob Livernash for editing and proofreading. We also thank the staff of Dever Designs for their work.

We are indebted to The David & Lucile Packard Foundation, the Netherlands Ministry of Foreign Affairs, the Royal Danish Ministry of Foreign Affairs, the Swedish International Biodiversity Programme, and the World Business Council for Sustainable Development for their generous financial support for this undertaking.

This report is released in the name of the World Resources Institute (WRI), the Meridian Institute, and the World Business Council for Sustainable Development (WBCSD). It is the result of a collaborative effort by WRI, Meridian, and the WBCSD secretariat. It does not necessarily represent the views of WRI, Meridian, WBCSD members, or the publication’s funders.

This publication was updated in 2012 by Suzanne Ozment (World Resources Institute) and Eva Zabey (World Business Council for Sustainable Development). The 2nd version of this publication was also helped along by Robert Winterbottom (WRI), Nick Price (WRI), Maggie Powell, Sylvia Song, and the staff at Sveconway Printing and Marketing Solutions.
Ecosystems provide businesses with numerous benefits or “ecosystem services.” Forests supply timber and wood fiber, purify water, regulate climate, and yield genetic resources. River systems supply freshwater, power, and recreation. Coastal wetlands filter waste, mitigate floods, and serve as nurseries for commercial fisheries.

However, human activities are rapidly degrading these and other ecosystems. The Millennium Ecosystem Assessment—the largest audit ever conducted of the condition and trends in the world’s ecosystems—found that ecosystems have declined more rapidly and extensively over the past 50 years than at any other comparable time in human history. In fact, 15 of the 24 ecosystem services evaluated have degraded over the past half century. The Assessment projected further declines over coming decades, particularly in light of population growth, economic expansion, and global climate change. Left unchecked, this degradation could jeopardize future economic well-being, creating new winners and losers within the business community.

Ecosystem degradation is highly relevant to business because companies not only impact ecosystems and the services they provide but also depend on them. Ecosystem degradation, therefore, can pose a number of risks to corporate performance as well as create new business opportunities. Types of risks and opportunities include:

• **Operational**
  – Risks such as higher costs for freshwater due to scarcity, lower output for hydroelectric facilities due to siltation, or disruptions to coastal businesses due to flooding
  – Opportunities such as increasing water-use efficiency or building an on-site wetland to circumvent the need for new water treatment infrastructure

• **Regulatory and legal**
  – Risks such as new fines, new user fees, government regulations, or lawsuits by local communities that lose ecosystem services due to corporate activities
  – Opportunities such as engaging governments to develop policies and incentives to protect or restore ecosystems that provide services a company needs

• **Reputational**
  – Risks such as retail companies being targeted by nongovernmental organization campaigns for purchasing wood or paper from sensitive forests or banks facing similar protests due to investments that degrade pristine ecosystems
  – Opportunities such as implementing and communicating sustainable purchasing, operating, or investment practices in order to differentiate corporate brands

• **Market and product**
  – Risks such as customers switching to other suppliers that offer products with lower ecosystem impacts or governments implementing new sustainable procurement policies
  – Opportunities such as launching new products and services that reduce customer impacts on ecosystems, participating in emerging markets for carbon sequestration and watershed protection, capturing new revenue streams from company-owned natural assets, and offering eco-labeled wood, seafood, produce, and other products

• **Financing**
  – Risks such as banks implementing more rigorous lending requirements for corporate loans
  – Opportunities such as banks offering more favorable loan terms or investors taking positions in companies supplying products and services that improve resource-use efficiency or restore degraded ecosystems.

Unfortunately, companies often fail to make the connection between the health of ecosystems and the business bottom line. Many companies are not fully aware of the extent of their dependence and impact on ecosystems and the possible ramifications. Likewise, environmental management systems and environmental due diligence tools are often not fully attuned to the risks and opportunities arising from the degradation and use of ecosystem services. For instance, many tools are more suited to handle “traditional” issues of pollution and natural resource consumption. Most focus on environmental impacts, not dependence. Furthermore, they typically focus on risks, not business opportunities. As a result, companies may be caught unprepared or miss new sources of revenue associated with ecosystem change.
The Corporate Ecosystem Services Review (ESR) is designed to address these gaps. It consists of a structured methodology that helps managers proactively develop strategies to manage business risks and opportunities arising from their company’s dependence and impact on ecosystems. It is a tool for strategy development, not just for environmental assessment. Businesses can either conduct an Ecosystem Services Review as a stand-alone process or integrate it into their existing environmental management systems. In both cases, the methodology can complement and augment the environmental due diligence tools companies already use.

The Ecosystem Services Review can provide value to businesses in industries that directly interact with ecosystems such as agriculture, beverages, water services, forestry, electricity, oil, gas, mining, and tourism. It is also relevant to sectors such as general retail, healthcare, consulting, financial services, and others to the degree that their suppliers or customers interact directly with ecosystems. General retailers, for example, may face reputational or market risks if some of their suppliers are responsible for degrading ecosystems and the services they provide.

This publication describes the five steps for performing an Ecosystem Services Review (Table 1). It provides an analytical framework, case examples, and helpful suggestions for each step. It concludes by highlighting a number of resources managers can use when conducting an Ecosystem Services Review, including a “dependence and impact assessment” spreadsheet, scientific reports, economic valuation approaches, and other issue-specific tools.

As of 2012, an estimated 300 companies have used the Ecosystem Services Review. In addition, complementary tools and guidance now exist to help companies more fully assess business risks and opportunities emerging from ecosystem change. For example, in 2011 the World Business Council for Sustainable Development released the Guide to Corporate Ecosystem Valuation (CEV), which provides information on how to quantitatively, or in some cases monetarily, assess risks and opportunities related to ecosystem services. CEV can therefore be a logical next step after undertaking an ESR. The Economics of Ecosystems and Biodiversity (2010) highlighted new examples of the linkages between business and ecosystem services. The ESR remains a fundamental starting point for companies to assess business risks and opportunities related to ecosystem change.

Global degradation of ecosystems and the services they provide threatens to alter the landscape in which business operates. The Ecosystem Services Review is a proactive approach for companies to manage the risks and opportunities that are emerging. Furthermore, by helping companies make the connection between healthy ecosystems and the bottom line, it will encourage not only more sustainable business practices, but also corporate support for policies to protect and restore ecosystems.

* See Chapter III for examples and details.
** Estimates are based on feedback from approximately 50 companies and reflect one full-time equivalent. Time required to conduct an ESR will vary based on several factors including the scope selected, availability of information, and number of staff allocated to gather information and conduct research and interviews. As a less time-intensive option, some companies conducted steps 2, 4, and 5 in half-day workshops.
ECOSYSTEM CHANGE AS SOURCE OF BUSINESS RISK AND OPPORTUNITY

What do these five stories—which cross a number of continents and industries—have in common?

• In the 1980s, mineral water company Vittel (now a brand of Nestlé Waters) faced a critical problem. Nitrates and pesticides were entering the company’s springs in northeastern France. Local farmers had intensified agricultural practices and cleared native vegetation that previously had filtered water before it seeped into the aquifer used by Vittel. This contamination threatened the company’s right to use the “natural mineral water” label under French law. The Vittel brand and business were at stake.1

• Costa Rican hydropower company Energía Global (now Enel Latin America) faced a different crisis. In the 1990s, it was literally losing its source of power. Landowners were clearing the forested slopes upstream of the company’s dams for livestock and agriculture. With the trees gone, heavy rains were causing increased soil erosion and river sedimentation, lowering dam reservoir capacity and power output.2

• Unilever—an international manufacturer of food, home care, and personal care products with brands such as Lipton, Surf, and Vaseline—experienced a problem at sea. Cod was the main fish used in the company’s premium frozen food products. In the 1990s, however, cod stocks declined precipitously and collapsed altogether in the western North Atlantic due to overexploitation. The dramatic price increases that ensued reduced margins on Unilever’s cod-related products by 30 percent.3

• Potlatch, a U.S.-based wood products company, did not encounter a threat but rather an opportunity. For years, the company had managed its forests for timber. However, its 270,000 hectares of forest in Idaho were a popular destination for hikers, campers, birdwatchers, and hunters, drawing approximately 200,000 visitor-use-days per year. Recognizing an opportunity for a complementary source of revenue, the company introduced user fees in 2007 to capture the recreational value its forests provide.4

• Allegheny Power had its own kind of opportunity. Earlier this decade, the U.S.-based electric utility wanted to divest its 4,800-hectare Canaan Valley property in West Virginia. Traditional approaches appraised the real estate at $16 million. Believing the property—with its pristine forests, marshes, and abundant wildlife—was worth more, the company commissioned an economic valuation of the marketable environmental benefits provided by the site, including its ability to sequester carbon and its wetlands. The eco-assessment boosted the total value to nearly $33 million. Allegheny Power subsequently sold Canaan Valley to the U.S. government—which merged it with an existing wildlife refuge—for the traditional appraisal price of $16 million. Using “bargain sale” provisions in the federal tax code, however, the company was able to claim a charitable contribution of $17 million for the property’s environmental value, yielding several million dollars in tax-related savings.5

All of these stories share at least one aspect: they highlight companies facing unexpected risks or novel opportunities arising from their dependence and impact on ecosystems. Vittel, Energía Global, and Unilever faced risks to their bottom lines due to the deterioration of an ecosystem upon which their businesses depended. Potlatch and Allegheny Power seized new business opportunities by tapping into the value of ecosystems.
But these examples are not isolated cases. Other companies face similar risks and opportunities as the world’s ecosystems undergo rapid change due to human pressures. However, many companies are not fully aware of the business implications of their dependence and impact on ecosystems and the services they provide.

The Corporate Ecosystem Services Review (ESR) is designed to make this link and inform corporate strategy. The ESR is a structured methodology that helps managers proactively develop strategies to manage business risks and opportunities arising from their company’s dependence and impact on ecosystems. It is designed for use by sectors ranging from extractive industries and agribusiness to manufacturing and retail. For each of these sectors, it can support a number of corporate decisions and processes (Box 1).

This publication guides business managers on how to conduct an ESR by:

- Introducing the concept of “ecosystem services” as a framework for assessing a company’s dependence and impact on the environment
- Describing a process for identifying which ecosystem services are ‘priority’ services; that is, those most relevant to a company’s performance
- Providing a structured approach for analyzing important trends in these priority ecosystem services
- Offering a framework for identifying potential business risks and opportunities arising from these trends

Box 1 Business Decisions and Processes the Corporate ESR Can Support

- Corporate, business unit, or market strategy development
- Planning processes for corporate infrastructure projects such as mines, wells, pipelines, plantations, and facilities
- Identification of new markets, products, or services
- Identification of new revenue streams from corporate landholdings
- Investments in projects or companies
- Policy-maker engagement strategies
- Environmental impact assessments
- Environmental reporting

- Providing guidance on developing strategies to manage these risks and opportunities
- Illustrating how companies such as Vittel, Energia Global, Unilever, and others successfully addressed ecosystem-related risks and opportunities.

The ESR was developed by the World Resources Institute with support from the Meridian Institute and the World Business Council for Sustainable Development (WBCSD). Five WBCSD member companies “road-tested” the methodology and provided feedback that was incorporated into its design. The ESR also received input from a number of other companies (Box 2).

Box 2 The Corporate ESR Developers, Road-Test Companies, and Corporate Reviewers

Developers
- The World Resources Institute (www.wri.org) is a global, nonprofit environmental think tank that goes beyond research to find practical ways to protect the Earth and improve people’s lives.
- The Meridian Institute (www.merid.org) is a nonprofit organization that helps decisionmakers and diverse stakeholders solve some of society’s most contentious public policy issues. Meridian facilitated the Millennium Ecosystem Assessment.
- The World Business Council for Sustainable Development (www.wbcsd.org) brings together some 200 international companies in a shared commitment to sustainable development through economic growth, ecological balance, and social progress.

Road-test companies
- Akzo Nobel (www.akzonobel.com) serves customers throughout the world with coatings and chemicals.
- BC Hydro (www.bchydro.com) is one of the largest electrical companies in Canada whose purpose is to provide reliable power at low cost for generations.
- Mondi (www.mondigroup.com) is a leading international paper and packaging group operating in 35 countries and is Europe’s largest producer of kraft paper and office paper.
- Rio Tinto (www.riotinto.com) is a mining and exploration company with operations on every continent whose products include aluminum, copper, diamonds, energy products, iron ore, gold, and industrial minerals.
- Syngenta (www.syngenta.com) is a worldwide agribusiness committed to sustainable agriculture through innovative research and technology.

Corporate reviewers
- Citi Smith Barney
- Det Norske Veritas
- Energias de Portugal
- ERS Global, Inc.
- ETS Global, Inc.
- KPMG
- GreenOrder
- Hitachi Chemical Co., Ltd.
- Holcim
- SGS SA

As of 2012, an estimated 300 companies have used or are using the ESR. For more information on recent applications of the ESR, including new case studies, visit www.wri.org/ecosystems/esr
INTRODUCING ECOSYSTEM SERVICES

Ecosystems provide businesses—as well as people and communities—with a wide range of goods and services. For example, forests supply timber and wood fiber, regulate climate by absorbing carbon dioxide, and yield genetic resources for medicines. Coral reefs attract tourists, serve as nurseries for commercial fish species, and protect properties along coastlines from storm surges. Wetlands absorb waste, help reduce floods, and purify water. These and other benefits from nature are known as “ecosystem services” (see Box 3 for this and other key terms).

Categories of ecosystem services

The Millennium Ecosystem Assessment shed light on the importance of ecosystem services for human well-being and business development. The Assessment was a four-year international audit of ecosystems that involved more than 1,360 scientists, economists, business professionals, and other experts from 95 countries. Its findings provide the first state-of-the-art scientific evaluation of the condition and trends in the world’s ecosystems and the services they provide, as well as the scientific basis for action to conserve and use them sustainably. The Assessment defined four categories of services:

- **Provisioning services:** The goods or products obtained from ecosystems such as food, freshwater, timber, and fiber.
- **Regulating services:** The benefits obtained from an ecosystem’s control of natural processes such as climate, disease, erosion, water flows, and pollination, as well as protection from natural hazards. “Regulating” in this context is a natural phenomenon and is not to be confused with government policies or regulations.
- **Cultural services:** The nonmaterial benefits obtained from ecosystems such as recreation, spiritual values, and aesthetic enjoyment.
- **Supporting services:** The natural processes such as nutrient cycling and primary production that maintain the other services.

Beneficiaries of these services can be at the local, regional, and/or global scale and may include future generations. For instance, a forest may provide local people with wild food, natural fibers, and fuelwood. At a regional level, it may prevent landslides, filter water, and offer recreation for inhabitants of a nearby city. At a global level, this forest may sequester carbon dioxide—helping to regulate greenhouse gas concentrations in the atmosphere—and be the home of a rare plant with pharmaceutical properties that benefit people around the world.

Table 2 lists, defines, and provides examples of the ecosystem services analyzed by the Millennium Ecosystem Assessment.

| Food                             | Crops                  | Cultivated plants or agricultural produce harvested by people for human or animal consumption as food | • Grains  
• Vegetables  
• Fruits                                                   |
| Livestock                        |                        | Animals raised for domestic or commercial consumption or use                                       | • Chickens  
• Pigs  
• Cattle                                                     |
| Capture fisheries                | Wild fish captured through trawling and other non-farming methods |                                                                                               | • Cod  
• Crabs  
• Tuna                                                     |
| Aquaculture                      | Fish, shellfish, and/or plants that are bred and reared in ponds, enclosures, and other forms of freshwater or saltwater confinement for purposes of harvesting |                                                                                               | • Shrimp  
• Oysters  
• Salmon                                                   |
| Wild foods                       | Edible plant and animal species gathered or captured in the wild |                                                                                               | • Fruits and nuts  
• Fungi  
• Bushmeat                                                  |
| **Biological raw materials**     | Timber and other wood products | Products made from trees harvested from natural forest ecosystems, plantations, or non-forested lands | • Industrial roundwood  
• Wood pulp  
• Paper                                                     |
| Fibers and resins                | Non-wood and non-fuel fibers and resins |                                                                                               | • Cotton, silk, hemp  
• Twine, rope  
• Natural rubber                                             |
| Animal skins                     | Processed skins of cattle, deer, pig, snakes, sting rays, or other animals |                                                                                               | • Leather, rawhide, cordwain                             |
| Sand                             | Sand formed from coral and shells |                                                                                               | • White sand from coral and white shells  
• Colored sand from shells                                     |
| Ornamental resources             | Products derived from ecosystems that serve aesthetic purposes |                                                                                               | • Tagua nut, wild flowers, coral jewelry                  |
| **Biomass fuel**                 |                        | Biological material derived from living or recently living organisms—that serves as a source of energy | • Fuelwood and charcoal  
• Grain for ethanol production  
• Dung                                                      |
| Freshwater                       |                        | Inland bodies of water, groundwater, rainwater, and surface waters for household, industrial, and agricultural uses | • Freshwater for drinking, cleaning, cooling, industrial processes, electricity generation, or mode of transportation |
| Genetic resources                |                        | Genes and genetic information used for animal breeding, plant improvement, and biotechnology | • Genes used to increase crop resistance to disease or pests |
| Biochemicals, natural medicines, and pharmaceuticals |                        | Medicines, biocides, food additives, and other biological materials derived from ecosystem for commercial or domestic use | • Echinacea, ginseng, garlic  
• Paclitaxel as basis for cancer drugs  
• Tree extracts used for pest control                      |
| **Regulating services: The benefits obtained from an ecosystem’s control of natural processes** |                        |                                                                                                |                                                         |
| Maintenance of air quality       |                        | Influence ecosystems have on air quality by emitting chemicals to the atmosphere (i.e., serving as a “source”) or extracting chemicals from the atmosphere (i.e., serving as a “sink”) | • Lakes serve as a sink for industrial emissions of sulfur compounds  
• Tree and shrub leaves trap air pollutants near roadways |
| Regulation of climate            | Global                 | Influence ecosystems have on the global climate by emitting greenhouse gases or aerosols to the atmosphere or by absorbing greenhouse gases or aerosols from the atmosphere | • Forests capture and store carbon dioxide  
• Cattle and rice paddies emit methane                       |
|                                  | Regional and local     | Influence ecosystems have on local or regional temperature, precipitation, and other climatic factors | • Forests can impact regional rainfall levels              |
| Regulation of water timing and flows |                        | Influence ecosystems have on the timing and magnitude of water runoff, flooding, and aquifer recharge, particularly in terms of the water storage potential of the ecosystem or landscape | • Permeable soil facilitates aquifer recharge  
• River floodplains and wetlands retain water—which can decrease flooding—reducing the need for engineered flood control infrastructure |

| Erosion control | Role ecosystems play in retaining and replenishing soil and sand deposits | *Vegetation such as grass and trees prevents soil loss due to wind and rain and prevents siltation of waterways*  
*Corals reefs, oyster reefs, and sea grass beds reduce loss of land and beaches due to waves and storms* |
| Water purification and waste treatment | Role ecosystems play in the filtration and decomposition of organic wastes and pollutants in water; assimilation and detoxification of compounds through soil and subsoil processes | *Wetlands remove harmful pollutants from water by trapping metals and organic materials*  
*Soil microbes degrade organic waste, rendering it less harmful* |
| Disease mitigation | Influence that ecosystems have on the incidence and abundance of human pathogens | *Some intact forests reduce the occurrence of standing water—a breeding area for mosquitoes—which lowers the prevalence of malaria* |
| Maintenance of soil quality | Role ecosystems play in sustaining soil's biological activity, diversity and productivity; regulating and partitioning water and solute flow; storing and recycling nutrients and gases, among other functions | *Some organisms aid in decomposition of organic matter, increasing soil nutrient levels*  
*Some organisms aerate soil, improve soil chemistry, and increase moisture retention* |
| Pest mitigation | Influence ecosystems have on the prevalence of crop and livestock pests and diseases | *Predators from nearby forests—such as bats, toads, and snakes—consume crop pests* |
| Pollination | Role ecosystems play in transferring pollen from male to female flower parts | *Bees from nearby forests pollinate crops* |
| Natural hazard mitigation | Capacity for ecosystems to reduce the damage caused by natural disasters such as hurricanes and tsunamis and to maintain natural fire frequency and intensity | *Mangrove forests and coral reefs protect coastlines from storm surges*  
*Biological decomposition processes reduce potential fuel for wildfires* |
| **Cultural services: The nonmaterial benefits obtained from ecosystems** | | |
| Recreation and ecotourism | Recreational pleasure people derive from natural or cultivated ecosystems | *Hiking, camping, and bird watching*  
*Going on safari*  
*Scuba diving* |
| Ethical and spiritual values | Spiritual, religious, aesthetic, intrinsic, “existence,” or similar values people attach to ecosystems, landscapes, or species | *Spiritual fulfillment derived from sacred lands and rivers*  
*People’s desire to protect endangered species and rare habitats* |
| Educational and inspirational values | Information derived from ecosystems used for intellectual development, culture, art, design, and innovation | *The structure of tree leaves has inspired technological improvements in solar power cells*  
*School fieldtrips to nature preserves aid in teaching scientific concepts and research skills* |
| **Supporting services: The natural processes that maintain the other ecosystem services** | | |
| Habitat | Natural or semi-natural spaces that maintain species populations and protect the capacity of ecological communities to recover from disturbances | *Native plant communities often provide pollinators with food and structure for reproduction*  
*Rivers and estuaries provide nurseries for fish reproduction and juvenile development*  
*Large natural areas and biological corridors allow animals to survive forest fires and other disturbances* |
| Nutrient cycling | Flow of nutrients (e.g., nitrogen, sulfur, phosphorus, carbon) through ecosystems | *Transfer of nitrogen from plants to soil, from soil to oceans, from oceans to the atmosphere, and from the atmosphere to plants* |
| Primary production | Formation of biological material by plants through photosynthesis and nutrient assimilation | *Algae transform sunlight and nutrients into biomass, thereby forming the base of the food chain in aquatic ecosystems* |
| Water cycling | Flow of water through ecosystems in its solid, liquid, or gaseous forms | *Transfer of water from soil to plants, plants to air, and air to rain* |

**Sources:**

Box 4  Frequently Asked Questions about Ecosystem Services

Is biodiversity an ecosystem service? Ecosystem services are sometimes confused with biodiversity. Biodiversity is not itself an ecosystem service but rather underpins the supply of ecosystem services. The value some people place on biodiversity for its own sake is captured under the cultural ecosystem service called “ethical values” (Table 2). Other ecosystem services closely associated with biodiversity include food, genetic resources, timber, biomass fuel, recreation, and ecotourism.

Are minerals and fossil fuels ecosystem services? Minerals and fossil fuels—coal, oil, and natural gas—are examples of natural resources that are not ecosystem services. The quantity and quality of minerals and fossil fuels are not dependent upon the living component of existing ecosystems and therefore are not benefits derived from ecosystems. Although fossil fuels and some minerals come from organic material that was alive millions of years ago, this timeframe is not relevant for business or policy decisions.

If fossil fuels are not an ecosystem service, then why is freshwater considered one? Unlike fossil fuels, freshwater is a resource the quantity and quality of which is often dependent upon living components of ecosystems. For instance, forests affect the quantity and quality of freshwater in a region by soaking up water through tree roots, releasing water vapor through leaves, and preventing siltation of rivers.

What is the difference between climate change, global climate regulation services, and local climate regulation services? Climate change refers to any significant alteration in the Earth’s temperature, precipitation, or other climatic factors lasting for an extended period of time. Although climate change may result from natural factors, the term is commonly used to refer to alterations resulting from human activities that increase atmospheric greenhouse gas concentrations such as the burning of fossil fuels or deforestation. Global climate regulation is the influence an ecosystem has on global climate primarily by altering the concentration of greenhouse gases in the atmosphere. For example, trees absorb carbon dioxide when they grow and release it if they are burned. Local climate regulation is the influence an ecosystem has on local temperature, precipitation, or other climatic factors through effects such as providing shade, trapping or releasing moisture, and absorbing or reflecting sunlight.

Assessment and The Economics of Ecosystems and Biodiversity. It is an important resource for conducting an ESR. Box 4 answers some frequently asked questions about ecosystem services.

Trends in ecosystem services

Although buffered against ecosystem change by culture and technology, all people and businesses fundamentally depend on the flow of ecosystem services. However, the ability of ecosystems to continue providing many of these services is in jeopardy. The Millennium Ecosystem Assessment found that people have changed ecosystems more rapidly and extensively over the past 50 years than in any comparable period of time in human history. For example:

• More land was converted to cropland between 1950 and 1980 than in the 150 years spanning 1700 to 1850. With a quarter of the Earth’s terrestrial surface now used for crops or confined livestock, further increases in agricultural output will likely have to come from more intensive management of existing cultivated areas.

• More than half of the synthetic nitrogen fertilizer ever used has been applied over the past two decades, contributing to an increase in the number of waterways at risk of becoming “dead zones” for commercial fisheries.

• Water withdrawals from rivers and lakes doubled since 1960, with long-term implications for the availability and flow of freshwater in some regions.

• Twenty percent of the world’s coral reefs and nearly a quarter of its mangrove forests have been lost since about 1980, along with their capacity to buffer coastlines from storms.

• Wild marine fish harvests peaked in the 1980s and have since remained static, with implications for all those who rely on maritime resources.7

These changes have led to the deterioration in the quantity and/or quality of many ecosystem services. The Assessment found that 60 percent—15 out of 24—of the ecosystem services evaluated were degraded over the past 50 years (Table 3). Five services were rated “mixed,” increasing in supply or quality in some regions of the world but decreasing in others. Three provisioning services—crops, livestock, and aquaculture—were rated as “enhanced,” reflecting people’s focus on managing ecosystems to generate food for a growing population.8 Yet actions to increase these three provisioning services have inadvertently led to the degradation of many regulating and cultural services, most of which have no value in the marketplace until they are lost. In other words, there are often trade-offs between the services.

Why business should be concerned

The Millennium Ecosystem Assessment projected that the degradation of ecosystems and the services they provide will grow significantly worse in the first half of the 21st century, particularly as the global population swells toward 9.2 billion, emerging economies increase per capita consumption levels, and climate change unfolds. The Assessment also warned that further ecosystem deterioration increases the risk that some services such as freshwater supply, natural hazard regulation, and wild foods may cross a threshold after which they abruptly and possibly irreversibly decline.
These trends matter to companies because business and ecosystems are inter-related. Businesses impact ecosystems through consumption, pollution, land conversion, and other activities. At the same time, businesses depend on ecosystems. The beverage industry, for example, depends on the supply of freshwater. Agribusiness relies on nature’s pollination, pest control, and erosion control services. Insurance companies benefit from the coastal protection provided by coral reefs, while the tourism industry benefits from this ecosystem’s recreational value. Since many of these benefits are received for free, business often takes them for granted until the service becomes stressed or disappears.

Because of these impacts and dependencies, the degradation of ecosystems can present a number of business risks as well as new opportunities. Types of risks and opportunities include:

• **Operational**
  – Risks such as higher costs for freshwater due to scarcity, lower output for hydroelectric facilities due to siltation, or disruptions to coastal businesses due to flooding
  – Opportunities such as increasing water-use efficiency or building an on-site wetland to circumvent the need for new water treatment infrastructure

• **Regulatory and legal**
  – Risks such as new fines, new user fees, government regulations, or lawsuits by local communities that lose ecosystem services due to corporate activities
  – Opportunities such as engaging governments to develop policies and incentives to protect or restore ecosystems that provide services a company needs

• **Reputational**
  – Risks such as retail companies being targeted by nongovernmental organization campaigns for purchasing wood or paper from sensitive forests or banks facing similar protests due to investments that degrade pristine ecosystems
  – Opportunities such as implementing and communicating sustainable purchasing, operating, or investment practices in order to differentiate corporate brands

• **Market and product**
  – Risks such as customers switching to other suppliers that offer products with lower ecosystem impacts or governments implementing new sustainable procurement policies
  – Opportunities such as launching new products and services that reduce customer impacts on ecosystems, participating in emerging markets for carbon sequestration and watershed protection, capturing new revenue streams from company-owned natural assets, and offering eco-labeled wood, seafood, produce, and other products

• **Financing**
  – Risks such as banks implementing more rigorous lending requirements for corporate loans
  – Opportunities such as banks offering more favorable loan terms or investors taking positions in companies supplying products and services that improve resource-use efficiency or restore degraded ecosystems.

LINKING ECOSYSTEM SERVICES AND BUSINESS GOALS: THE ESR

Many businesses, unfortunately, fail to make the connection between the health of ecosystems and corporate performance. Companies often are not fully aware of the extent of their dependence and impact on ecosystems and the possible ramifications.

Likewise, environmental management systems and environmental due diligence tools are often not fully attuned to the risks and opportunities arising from the degradation of ecosystems and the services they provide. For instance, many tools are more suited to handle “traditional” issues of pollution and resource consumption. Most focus on environmental impact, not dependence. Furthermore, they typically focus on risks, not business opportunities. Consequently, companies may be caught unprepared or miss new sources of revenue associated with ecosystem change.

The ESR is designed to meet this business need. It is a methodology that helps managers identify the connections between a company’s impact or dependence on ecosystem services and potential business risks or opportunities. In this manner, it can inform and strengthen business strategy.

Which sectors

The ESR can be useful to companies from a variety of sectors. It is relevant to businesses in industries that directly interact with ecosystems—such as agriculture, beverages, water services, forestry, electricity, oil, gas, mining, and tourism. It is also relevant to sectors such as general retail, healthcare, consulting, financial services, manufacturing, and others to the degree that their suppliers or customers interact directly with ecosystems (Box 5). General retailers, for example, may face reputational or market risks if some of their suppliers are responsible for degrading ecosystems and the services they provide. Financial services firms may face similar risks due to their investments.

Business benefits

Road-test experience indicates that the ESR can provide a number of business benefits such as:

• Identifying new business risks and opportunities arising from a company’s dependence and impact on ecosystems and the services they provide. Because the framework of ecosystem services is a new approach for assessing the inter-relationship between business and the environment, the ESR can uncover sources of risk and opportunity that traditional strategy development processes miss.

• Framing and giving added urgency to risks or opportunities previously identified by management. The ESR can yield new information that raises the profile of issues the company may have considered in the past but that are now worthy of greater attention.

• Anticipating new markets and influencing government policies that will emerge in response to ecosystem degradation. The ESR can help managers identify opportunities to participate in emerging ecosystem service-related markets such as payments for carbon sequestration, mitigation banking, and eco-labeling systems. It also can help managers prepare for new government regulations and participate in the development of new public policies.

• Strengthening existing approaches to environmental management. The ESR can complement existing environmental management systems and due diligence tools in a number of ways. First, the ESR fills gaps by evaluating a suite of environmental and business issues that traditional processes and tools do not address (Box 6). Second, the ESR—or elements of it—can be directly integrated into a company’s existing environmental due diligence tools. Third, managers can use the ESR to screen or prioritize which environmental issues to evaluate with existing tools.

• Improving stakeholder relationships. Many natural resource conflicts that companies face relate to the fact that stakeholders—communities, indigenous people, other industry sectors, nongovernmental organizations—value different services coming from the same ecosystem (Box 7). The ESR can improve a company’s understanding of these issues and identify options for better managing trade-offs.

• Demonstrating leadership in corporate sustainability by proactively addressing the degradation of ecosystem services. Several observers have identified this issue as the next big “global environmental problem” that may garner political attention and impact business. This issue is where climate change was 10 years ago and similarly may grow to become a preeminent concern.
The ESR has several features to make it user-friendly:

• It offers a structured methodology to help companies understand their dependence and impact on ecosystems and the resulting business risks and opportunities in a coherent, systematic manner.

• It leverages existing, relevant data that companies may have on hand, although additional research and input are likely required as well.

• It has a simple design allowing managers to tailor it to meet their own needs and existing processes.

• It provides supporting tools and information to help managers throughout the review, including:
  – A complete list of ecosystem services, definitions, and examples;
  – A questionnaire and spreadsheet for assessing corporate dependence and impact on ecosystem services;
  – A framework and set of questions to guide analysis of ecosystem service trends;
  – An extensive list and case examples of business risks and opportunities that might arise from trends in ecosystem services;
  – A framework to guide the development of strategies for addressing these risks and opportunities; and
  – Suggested data sources and case studies throughout.

Box 5 Akzo Nobel Conducts an ESR

The paper and pulp industry both impacts and depends upon forests. This inter-relationship is especially prevalent in Indonesia and China, an emerging epicenter of global paper production. In these nations, rapid deforestation—and the associated loss of ecosystem services—is attracting increasing international attention. This presents significant operational, regulatory, and reputational risks to the industry.

Eka Chemicals—a division of the global coatings and chemicals manufacturer Akzo Nobel—is a leading supplier of cellulose processing agents to the paper and pulp industry. Eka recognized that forest ecosystem-related risks to its customers could translate into risks, as well as new business opportunities, for itself. But what are these risks and opportunities, and what options does Eka have to manage them?

To answer these questions, Akzo Nobel conducted an Ecosystem Services Review. Through a structured process, the ESR uncovered a set of risks Eka’s major China- and Indonesia-based customers would likely face due to ecosystem degradation. The ESR helped Eka translate its customers’ risks into a portfolio of risks and opportunities for itself. It also helped identify new strategies that the company could pursue to manage these challenges and opportunities.

Leveraging and augmenting analyses Eka had on hand, the ESR also was able to raise the profile of a number of options that managers had previously discussed but which now—in light of the ESR findings—have become more timely, relevant, and worthy of a business response.

Box 6 How the ESR Can Complement Other Environmental Management Approaches

Many companies already have environmental management systems and use due diligence tools such as environmental impact assessments, environmental and social impact assessments, and lifecycle assessments. The ESR can complement and strengthen these approaches by:

• Evaluating corporate activities with regard to the emerging issue of ecosystem services rather than more standard issues such as corporate emissions and effluents.

• Assessing all major ecosystem services.

• Assessing a company’s impact and dependence on ecosystems, not just its impact.

• Evaluating a company vis-à-vis the environment and what people value in ecosystems.

• Informing corporate strategy with information about business risks and opportunities.

Features
Prior to the mid-1990s, BC Hydro, a government-owned hydroelectric utility in British Columbia, found itself at odds with its regulators and others who relied on the waterways of British Columbia for fishing, recreation, spiritual and cultural values, and as a source of freshwater. In response to growing tensions among users, BC Hydro initiated discussions to seek a less adversarial way to reach resolution on the competing interests for water use. The province of British Columbia formally initiated a water use planning program to define suitable operating parameters that would balance environmental, social, and economic values.

The water use planning process, which was voluntary in nature, took a participatory approach and included users of the various ecosystem services in the watershed, including First Nations, environmental organizations, Fisheries and Oceans Canada, the government of British Columbia, and communities surrounding the hydroelectric facilities. With external assistance, BC Hydro developed a series of model-generated scenarios that illustrated how each user of the ecosystem would be affected as the company altered two operating variables: reservoir level and river flow rate. One scenario might yield more power generation but fewer recreational opportunities and less fish. Another might yield the opposite. Participants reviewed each scenario, discussed the trade-offs among ecosystem services, and used a value-based trade-off system to identify whether or not similar benefits to others who relied on the waterways of British Columbia for fishing, recreation, spiritual and cultural values, and as a source of freshwater. In response to growing tensions among users, BC Hydro initiated discussions to seek a less adversarial way to reach resolution on the competing interests for water use. The province of British Columbia formally initiated a water use planning program to define suitable operating parameters that would balance environmental, social, and economic values.

OVERVIEW
The ESR methodology consists of five steps (Figure 1):

1. **Select the scope.** Choose the “scope” or boundary within which to conduct the ESR. Candidates include a business unit, product, market, corporate landholdings, infrastructure project, major supplier, or major customer segment, among others.

2. **Identify priority ecosystem services.** Systematically evaluate the company’s dependence and impact on more than 20 ecosystem services. Determine which of these are “priority” services—the ones most relevant to corporate performance.

3. **Analyze trends in priority services.** Research and evaluate the condition and trends in the priority ecosystem services, as well as the drivers of these trends.

4. **Identify business risks and opportunities.** Identify and evaluate the business risks and opportunities that might arise due to trends in the priority ecosystem services.

5. **Develop strategies.** Outline strategies for managing the risks and opportunities.

As Figure 1 illustrates, the ESR bridges ecosystem and business considerations by starting with an evaluation of a company’s interaction with ecosystems and finishing with an assessment of implications for business performance.

**Who conducts an ESR?**
Table 4 outlines who should be involved in conducting an ESR during each step. Note that the Ecosystem Services Review generates most value when managers responsible for corporate strategy, business operations, and environmental performance collaborate. Managers can use or tailor the presentation available at www.wri.org/ecosystems/esr to make the case to colleagues about the value of conducting an ESR and educate them about the methodology. Companies can also opt to hire consultants to apply the ESR.

**Where to get information?**
Managers can tap into several sources of data and input when conducting an ESR (Table 5). Note that relying solely on internal business perspectives poses the risk that the ESR will merely perpetuate possible corporate misperceptions or knowledge gaps. Complementing internal information sources with those external to the company is highly recommended.

The following sections describe the five steps of the ESR in detail, introduce an analytical framework for each step, provide case examples, and offer some helpful hints.
Executive managers

Executive or senior managers responsible for corporate strategy and environmental performance need to be involved in selecting the scope and in formulating and approving the strategies emerging from the ESR. Their involvement encourages implementation of the ESR results.

Manager(s) from selected scope

One or more managers responsible from the selected scope—business unit, product line, regional market, project, etc.—should be involved in nearly every step since they will be responsible for implementing the strategies developed by the ESR.

Analysts

In-house analysts conduct most of the research, interviews, data preparation, and other activities involved in an ESR. They do not need to be experts in ecosystems.

Consultants (optional)

Management consultants can conduct an ESR on behalf of a company. Alternatively, consultants can be involved in selected steps, providing information, perspectives, and specialized tools/models for conducting ESR-related analyses.

In-house business managers and analysts

Managers and analysts may have perspectives relevant to every step of the ESR. One efficient way to gather their input is to host brainstorming sessions in which they jointly develop preliminary perspectives for the relevant ESR step. These “rapid assessment” sessions can help prioritize subsequent analyses, saving time.

Existing and new in-house analyses

Existing in-house analyses of the company’s impact on ecosystems, assessments of selected ecosystem services such as water, and profiles of selected ecosystem service trends can kick-start an ESR, even if these analyses were originally conducted for other purposes. Some new analyses, nevertheless, are often required to fill information gaps.

Local stakeholders

Engaging local stakeholders is highly recommended. Local stakeholders may include representatives from nearby communities, other companies, indigenous tribes, nongovernmental organizations, outdoor recreation clubs, etc. Interviewing or hosting meetings with stakeholders can help identify which ecosystem services they value. This input can help create a shortlist of services about which the company should carefully consider its impacts. A company exposes itself to potential risk when it impacts an ecosystem service that is valued by others.

Experts from universities and research institutions

Academics renowned for their knowledge of particular ecosystems, ecosystem services, or drivers of ecosystem change are often willing to share their expertise with businesses.

Millennium Ecosystem Assessment publications and experts

Millennium Ecosystem Assessment experts and reports offer detailed information about the condition and trends in ecosystems and ecosystem services, as well as analyses of the drivers of ecosystem change.

Nongovernmental organizations

Nongovernmental organizations typically have in-house experts and access to relevant research.

Industry associations

Industry associations may have in-house experts and access to topical research.

Published research

Relevant—preferably peer-reviewed—papers and studies can be accessed via the internet or libraries.

Other resources and tools

A number of issue-specific tools and resources can help corporate managers conduct more in-depth analyses. See Chapter III for more information.
STEP 1: SELECT THE SCOPE

The first step is to select the “scope” of the ESR. The purpose of this step is to define clear boundaries within which to conduct analysis in order to keep the process manageable and yield more actionable results.

For a business with just one major product, service, or market, the ESR scope could be the entire company. However, for a business with multiple products, services, or markets, a more manageable scope would be a particular portion of the company. Conducting a single ESR for the entirety of a diversified company would be resource-intensive and analytically complex because the company’s business units likely differ—sometimes significantly—in terms of how they interact with ecosystems. If such a diversified company wants to cover its entire business portfolio, it can do so by conducting a series of ESRs.

HELPFUL HINTS Step 1

- Be prepared to refine the scope as the ESR proceeds. For instance, Rio Tinto decided to narrow the boundaries of its review after finding the original scope too broad for manageable analysis.
- Consider spreading out the timing of conducting an ESR to coincide with data availability or existing strategy development or environmental assessment processes.
- Insights gained from conducting the ESR for one division of the company can be applicable to another to the degree that these divisions are similar. For example, the results of the ESR for one mine may be quite applicable to another nearby mine. However, they may be less applicable for a site located in another country due to differences in surrounding ecosystems and trends affecting ecosystems.

Three questions to ask

Three questions can help managers select an ESR scope (Figure 2):

1. Which stage of the value chain? An ESR could focus on a company’s own operations, providing insight into the direct implications that trends in ecosystem services would pose for the company. One alternative is to look “upstream” in the value chain. This approach would shed light on the implications of ecosystem service trends for key suppliers and the business risks and opportunities that these, in turn, may pose to the company conducting the ESR. Another alternative is to look “downstream.” This approach would provide insight into the implications of ecosystem service trends for the company’s major customers and the business risks and opportunities that these, in turn, may pose to the company. One helpful hint is to select a stage in the value chain where interactions with ecosystems are prominent since these interactions are the most likely sources of ecosystem service-related risk or opportunity. The Helpful Hints give other suggestions for selecting the scope.

2. Who and where specifically? If conducting the ESR on the company itself, then select a certain aspect of the business. Options include—but are not limited to—a particular business unit, product line, facility, project (such as a mine, pipeline, other infrastructure development), or natural asset owned by the company (such as forestland or other landholdings). If the ESR is focused on key suppliers, then choose a specific supplier or category of suppliers and perhaps further narrow the scope by selecting a particular geographic market in which these suppliers operate. If the ESR is focused on major customers, then choose a particular customer or customer segment and perhaps further refine the scope by selecting a particular geographic market in which these customers are located.

3. Is the candidate scope strategic, timely, and supported? Particularly for the first ESR, the scope should be of high strategic importance to the company. Examples include the company’s fastest growing market, an upcoming major product line, or the business unit with the greatest market share. The scope should offer a window of opportunity for the ESR to influence upcoming important business decisions. In addition, there should be sufficient internal management support for conducting an ESR within the selected scope. Be sure to secure relevant senior management buy-in and have staff (or consultants) available to conduct the interviews and analysis required in subsequent steps.

Box 8 profiles the scopes selected by the road-test companies. For the sake of simplicity, we will use the term “company” throughout the rest of the Guidelines to refer to the scope selected for the ESR.

Box 8 Examples from the Road Tests (Step 1)

**Akzo Nobel** chose to apply the ESR “downstream,” assessing the implications of ecosystem degradation for the major China- and Indonesia-based customers of its pulp and paper chemicals business unit, Eka Chemicals. The ESR thereby contributed to corporate decisions regarding whether or not to enter into business with certain prospective customers.

**BC Hydro** selected its Campbell River hydropower dam on Vancouver Island as its scope. Although one of the company’s smaller generation facilities, Campbell River is of strategic importance given its proximity to population centers and its fisheries resource. In addition, the facility had an abundance of environmental and social data already on hand.

**Mondi**, with substantial forest holdings in South Africa and Russia, selected three of its South African pine and eucalypt plantation areas—Shanduka, SyaQhubeka, and Tygerskloof—for its scope. These areas were chosen for the range of physical, climatic, and other environmental conditions under which the trees are grown.

**Rio Tinto** road tested the ESR for a prospective copper mine in Peru that was in the prefeasibility stage of project development. The ESR was timed to inform the major technical decisions about mine design that occur during this stage.

**Syngenta** focused its ESR on one of its customer segments, farmers in southern India. By looking “downstream,” the ESR helped the company identify risks its customers have been facing due to ecosystem degradation and, in turn, identify opportunities for Syngenta in the form of new products and services that would address or mitigate these risks. Syngenta selected India because the country is a significant growth market for agriculture. Given India’s geographic, demographic, agricultural, and climatic diversity, the company focused on the southern states of Andhra Pradesh, Karnataka, Kerala, Maharashtra, and Tamil Nadu to keep the analysis focused.

**STEP 2: IDENTIFY PRIORITY ECOSYSTEM SERVICES**

The second step is to evaluate in a structured yet rapid manner the company’s dependence and impact on more than 20 ecosystem services. This evaluation will help identify which of these are “priority” services—the ones most likely to be a source of risk or opportunity for the company. These priority ecosystem services are the focus of analysis in subsequent steps; the other services are screened out.

To identify its priority services, a company needs to understand its level of dependence and impact on each ecosystem service. This is because the ecosystem services that are sources of business risk or opportunity typically are those that the company highly depends upon and/or highly impacts. For instance, if a company highly depends upon an ecosystem service and that service becomes scarce or degrades, then the company may face business risk in the form of higher input costs or disruption to its operations. If a company negatively impacts an ecosystem service by depleting or degrading it, then the company’s actions may pose regulatory or reputational business risks. Conversely, if a company positively impacts an ecosystem service by supplying or enhancing it, then the company’s actions may give rise to possible new business opportunities or reputational benefits.

### Evaluating Dependence

Answering two questions for each ecosystem service listed in Table 2 (see pages 4 and 5) can help managers evaluate whether or not their company depends on an ecosystem service and, if so, by how much:

1. **Does this ecosystem service serve as an input?**
   - **Yes**: This question assesses whether the ecosystem service serves as an input for the company’s operations.
   - **No**: This question determines if the service has a functional substitute.

2. **If “yes” to question 1, then does this ecosystem service have cost-effective substitutes?**
   - **Yes**: This question assesses the existence of cost-effective substitutes for the service.
   - **No**: This question determines if the service has a functional substitute.

By answering these questions, companies can identify priority ecosystem services that require additional focus and analysis.
Evaluating impact

Answering the following three questions for each ecosystem service listed in Table 2 (see pages 4 and 5) can help managers evaluate whether or not their company impacts an ecosystem service and, if so, by how much:

3. Does the company affect the quantity or quality of this ecosystem service? A company impacts an ecosystem service if it affects the quantity or quality of that service. For example, a forest plantation affects the quantity of freshwater in its watershed. A business that fills in wetlands in order to construct a new facility may affect the quantity of water runoff and aquifer recharge. A firm in the extractive industries may affect the quality of a location’s recreation services by scarring the landscape or otherwise disturbing an ecosystem valued by hikers, campers, and others.

Be sure to consider the company’s indirect impacts or secondary effects, as well. Roads or pipelines installed by an oil and gas company, for instance, increase access by third parties to previously inaccessible areas. The resulting influx of people may affect the quantity or quality of several ecosystem services in the region. For example, in-migration might lead to deforestation, impacting freshwater, wild foods, carbon sequestration, erosion regulation, and the cultural services associated with a pristine ecosystem.

4. If “yes” to question 3, then is the company’s impact positive or negative? The impact is positive if the company increases the quantity or quality of the ecosystem service. For example, agribusiness can reduce the quantity of freshwater in a watershed. By removing mangroves, a coastal hotel or shrimp farm can decrease the quality of shoreline protection.

In the context of the ESR, the terms “positive” and “negative” are not intended to be judgmental but merely reflect whether a company increases or decreases the quantity or quality of an ecosystem service.

5. If “yes” to question 3, then does the company’s impact limit or enhance the ability of others to benefit from this ecosystem service? The degree to which a company impacts an ecosystem service in a manner that might pose a business risk or opportunity for itself is a function of whether or not the impact limits or enhances the ability of others to benefit from the service.

Answering “yes” to any of the following considerations indicates that managers should answer “yes” to question 5:

- Is the company’s impact on this ecosystem service a large share of the total local or regional impact? A company with a large contribution relative to others is more likely to be responsible—or perceived to be responsible—for limiting (or enhancing) the ability of others to benefit from the service. Illustrative examples include a company that consumes (or replenishes) 15 percent of the freshwater in a watershed, one that consumes (or supplies) 20 percent of the nation’s wood fiber, or one that is solely responsible for clearing (or restoring) a native grassland valued for its biodiversity and associated cultural services. There are no hard and fast rules for defining what constitutes a “large share.” Managers will need to use their own or expert judgment regarding the size of impact relative to the appropriate spatial scale for the ecosystem service.

- Is this ecosystem service already in short supply relative to demand? A company’s impact is more likely to limit (or enhance) the ability of others to benefit from the service if that service is already supply-constrained.

- Could the company’s impact push this ecosystem service across a physical threshold that leads to scarcity of the service or triggers a regulatory response? A company’s impact is more likely to limit (or enhance) the ability of others to benefit from the service if that service is nearing a physical or regulatory threshold. In a region where available freshwater is on the verge of being tapped out, for instance, a new resort or manufacturing facility that consumes water—albeit a small amount—may push that service across a threshold. Water shortages might occur as demand outstrips supply or as the government imposes water restrictions.
Note that a company’s impact on ecosystem services and the affected beneficiaries may exist on a variety of spatial and temporal scales. See Box 9 for suggestions on selecting the appropriate scale.

Answering “yes” to question 3 and “yes” to question 5 indicates that the company’s impact on the ecosystem service is high. Answering “yes” to question 3 and “no” to question 5 indicates that the company’s impact on the ecosystem service is medium. Answering “no” to question 3 indicates that the company’s impact on the ecosystem service is low or negligible (Figure 4).

The dependence and impact assessment can be qualitative and quick. Although answers to the five questions may be straightforward for some ecosystem services, this structured approach increases the likelihood of uncovering previously overlooked dependencies and impacts. The Dependence and Impact Assessment Tool that accompanies these Guidelines can help managers conduct the evaluation in a structured manner (Box 10).

**Prioritizing ecosystem services**

After completing the dependence and impact assessment, determine which are the priority ecosystem services for the company—those most likely to be sources of business risk and opportunity. The results of the assessment can serve as good input for the prioritization process. Select five to seven services in order to keep the ESR analysis focused and manageable going forward. The following are suggested guidelines for selecting the priority services:

- The top-tier candidates for priority ecosystem services are those deemed “high” in both categories—dependence and impact.

**Figure 4 Questions to Ask per Ecosystem Service When Evaluating Impact**

3. Does the company affect the quantity or quality of this ecosystem service? → No → Low impact

   Yes

4. Is the company’s impact positive or negative?

   Positive
   Negative

5. Does the company’s impact limit or enhance the ability of others to benefit from this ecosystem service? → No → Medium impact

   Yes

• The second-tier candidates are those deemed “high” in one category and “medium” in the other. The dependence and impact categories should have equal weighting; one is not more important than the other.
The third-tier candidates are those deemed “high” in one category and “low” in the other.

If too many services are deemed “high” in the impact category, give preference to the ones with “negative” impacts. Road-test companies found that the business implications of negative impacts often outweighed those of “positive” impacts.

A service deemed “high” can be screened out if the company has already recently reviewed business risks and opportunities regarding this ecosystem service. For example, Mondi identified “timber and other wood fiber” as an ecosystem service upon which it had a high, positive impact. However, Mondi did not select it as a priority because managers regularly assesses the status, trends, risks, and opportunities associated with this ecosystem service since wood fiber is the firm’s core business.

Those deemed “low” in both categories are not priority services.

Boxes 11 and 12 show the ecosystem service prioritization results for two road-test companies.
Mondi conducted a dependence and impact assessment for each of the three plantations in its road test. The dependence and impact summary matrix below profiles the results for one of the plantations.

**Box 11 Example from the Road Tests: Mondi (Step 2)**

Based on this assessment, Mondi selected six ecosystem services as priorities:
- **Freshwater.** Pine and eucalypt plantations significantly depend upon and impact the quantity of freshwater.
- **Regulation of water timing and flows.** The plantation depends upon the ability of the surrounding ecosystems to help regulate the timing of water flows.
- **Biomass fuel.** As a byproduct, the plantation generates biomass residues that can be utilized as a source of energy by the company’s mills, local villages, or other parties.
- **Global climate regulation.** The plantation impacts the carbon cycle since trees sequester carbon dioxide.
- **Recreation and ecotourism.** Given its proximity to the Greater St. Lucia Wetland Park, a World Heritage Site, the plantation—and the wetlands and grasslands it contains—have the potential to provide recreational or ecotourism benefits.
- **Livestock.** The plantation impacts the ecosystem service of livestock in that, by being a dedicated industrial tree farm, the site precludes surrounding villagers from using the landscape for large-scale livestock grazing. Selective controlled grazing on the wetlands and remnant grasslands is, however, widely practiced.
**Box 12** Example from the Road Tests: Syngenta (Step 2)

**Syngenta** looked “downstream” and conducted a dependence and impact assessment for one of its customer segments, farmers in southern India (see the dependence and impact summary matrix below).

</tbody>
</table>

Based on this assessment, the ESR team selected six priority ecosystem services:

- **Freshwater.** Agriculture in the region highly depends upon this ecosystem service for watering crops—on rain-fed and irrigated farms—and for generating electricity to run some irrigation systems. At the same time, farmers can impact freshwater quantity (through irrigation) and quality (through fertilizer and agrochemical runoff).

- **Regulation of water timing and flows.** Southern Indian farmers are dependent on the role that wetlands and other ecosystems play in managing the timing and magnitude of water runoff during the monsoon season and in recharging aquifers.

- **Erosion control.** Farmers depend on vegetation to retain topsoil. Poor agricultural practices are having some localized negative effects, but other practices such as living fences and minimum tillage are improving erosion control.

- **Pest mitigation.** Southern Indian farmers rely on some native organisms to help control crop pests in integrated crop management systems. But farming practices such as growing monocultures, fragmenting natural habitats, and inappropriately using agrochemicals are eroding nature’s ability to manage pests in the region.

- **Pollination.** Many crops in the region benefit from pollination by bees and other animals, although a substitute practice—pollination by human hand—is used especially for plant breeding. Although data are limited, agriculture in southern India likely has a negative impact on natural pollination due to conversion of pollinator habitat.

- **Nutrient cycling.** Crops depend on nature’s processing of nutrients such as nitrogen and phosphorus, but synthetic substitutes exist. Poor farming practices in the region sometimes inhibit this natural process, requiring more man-made inputs to replace lost nutrients.
The five to seven ecosystem services selected as priorities will become the focus of analysis in subsequent steps of the ESR. The other services are screened out, at least for the time being. Additional information uncovered while conducting the trends analysis in step 3 may lead managers to revisit step 2 and add—or subtract—one or more services to the list of priorities.

The Helpful Hints offer additional suggestions for step 2, based on experiences from the road tests. Box 13 outlines the sources, inputs, and perspectives that some road-test companies used during step 2.

**HELPFUL HINTS Step 2**

- Avoid “getting stuck” in step 2. It is just a screening exercise leading to the core of the ESR. Furthermore, managers can revisit step 2 if they later uncover pertinent new information.
- Engage stakeholders to determine which ecosystem services they value. This input can help create a shortlist of services about which the company should carefully consider its impacts.
- Consider not only actual impacts but also perceived impacts when conducting the dependence and impact assessment. Stakeholder perceptions of a company’s impact on ecosystem services can often be just as important a source of reputational risk as actual, physical impacts. Distinguish between those that are perceived and those that are physical in the “comments” section of the Dependence and Impact Assessment Tool.
- Most road-test companies chose to exclude the “supporting ecosystem services” (see Table 2 on pages 4 and 5) when conducting the ESR. These services are so basic and fundamental that they manifest themselves in many of the provisioning, regulating, and cultural services. “Primary production,” for example, is the foundation of timber, other fibers, crops, and biomass fuel. Considering this supporting service could lead to “double counting” or “double consideration” of services. Nevertheless, companies in some sectors such as agriculture or forestry may find it valuable to explicitly consider one or more supporting services—particularly nutrient cycling—given the direct interaction between these sectors and this service.
- Consider impacts alone, not actions to mitigate impacts. For example, when evaluating the effects of a prospective Rio Tinto mine on local biodiversity and the associated cultural services, the team was tempted to incorporate into the assessment possible “biodiversity offset” purchases. Offsets, however, are a possible strategy for minimizing risks caused by the mine’s impact. Risk mitigation strategies are considered during step 5 of the ESR.
- If the dependence and impact assessment becomes too complex, revisit step 1 to narrow the scope or split it into more than one ESR. The road test for Rio Tinto, for example, became easier once the team split the original scope into separate dependence and impact assessments for the mine site, the road, and the prospective port.
- Consider applying additional criteria if the first attempt at prioritizing ecosystem services fails to narrow the list to seven or fewer. Additional criteria could include the probability of the company having a high impact on an ecosystem service and the number of people affected, among others.

**Box 13 Examples of Sources of Input (Step 2)**

The ecosystems surrounding a hydroelectric facility—the river, reservoir, and forests—provide a variety of ecosystem services. As part of its water use planning process, BC Hydro convened a number of stakeholders to determine which services they valued and how the company’s dams impacted those services. The ecosystem services that stakeholders valued became BC Hydro’s shortlist of services that warranted careful consideration. Stakeholders included:

- Fisheries and Oceans Canada, the government department responsible for ensuring commercial fish species are managed sustainably and endangered species are protected
- The government of British Columbia, which is responsible for licensing hydroelectric facilities and management plans
- First Nations—the indigenous people of Canada—who value salmon and other species as sources of food, income, and cultural heritage
- Environmental organizations, representing people who place ethical value on the biodiversity within the forests and waters surrounding dams
- Local communities, who utilize the river system for drinking water and recreation.

**STEP 3: ANALYZE TRENDS IN PRIORITY ECOSYSTEM SERVICES**

The third step is to research and analyze the status and trends in the priority ecosystem services that were identified in step 2. The purpose of this research is to provide managers with a sufficient amount of relevant information and insights so that they can later identify business risks and opportunities that may arise from these trends.

**How to analyze**

For the trends analysis, conduct research to answer the following five questions for each of the ecosystem services identified as a “priority” in step 2:

1. **What are the condition and trends in the supply and demand for the ecosystem service?** Identify the present and expected future supply and demand for the service. When answering this question, it is important to determine up-front which aspects of supply and demand—quantity or quality—are the most relevant to
the company. The most relevant aspect may vary between ecosystem services and companies. For instance, trends in the quantity of the ecosystem service of timber may be most relevant for a wood products manufacturer. Trends in the quality of freshwater may be most important for a firm in the beverage industry. Similarly, when answering this question it is important to select the appropriate spatial and/or temporal scale for the ecosystem service under review (see Box 9 on page 16 for suggestions on selecting the appropriate scale).

2. **What direct drivers underlie these trends?** Identify the “direct drivers” of trends in the priority ecosystem service. Direct drivers are factors—natural or man-made—that cause changes in an ecosystem and its ability to supply ecosystem services. Common direct drivers include:

- **Changes in land use and land cover.** Examples include deforestation, conversion of natural grasslands to farms, and drainage of wetlands.
- **Overconsumption.** For instance, ecosystem services such as capture fisheries, wild foods, and freshwater can be exploited beyond their capacity to replenish themselves.
- **Climate change.** Climate change is expected to alter the quantity, distribution, and timing of many ecosystem services, including crops, capture fisheries, freshwater, and natural hazard regulation.\(^\text{14}\)
- **Discharge of pollution and overuse of fertilizers.** Examples include toxic chemical releases and nitrogen and phosphorus runoff. The latter can lead to excessive nutrient enrichment of coastal waters and the emergence of “dead zones.”\(^\text{15}\)
- **Introduction of invasive, non-native species.** By crowding out native species or preying on species lacking natural defenses, invasives such as the emerald ash borer (*Agrilus planipennis Fairmaire*) in North America, molasses grass (*Melinis minutiflora*) in South America, western corn rootworm (*Diabrotica virgifera virgifera*) in Europe, and giant African snails (*Achatina fulica*) in Asia can alter the structure and dynamics of an ecosystem and thereby the quality or quantity of ecosystem services it provides.\(^\text{16}\)

Assess these direct drivers in terms of their relative contribution to the trends, size of impact, location, and timing. In addition, be aware that these direct drivers can act not only in isolation but also interact at multiple geographic scales and time frames. For instance, climate change can lead to crop failures in one region, which can encourage overexploitation of ecosystems elsewhere. Invasive species can change land cover over time as they alter the species dynamics of ecosystems.

3. **What is the company’s contribution to these drivers?** Identify how, where, and to what degree the company is contributing or could contribute to the direct drivers of ecosystem change. If a company’s strategy, operations, or activities impact any of these drivers, then it will likely impact an ecosystem and the services provided.

Developing an understanding of the company’s role in relation to these drivers and trends is helpful preparation for identifying possible business risks and opportunities in step 4 of the ESR.

4. **What is the contribution of others to these drivers?** Identify who else is contributing to these drivers of ecosystem change. Contributors might include local communities, farmers, other companies, or other industry sectors. Determine how, where, and to what degree these contributors are affecting the drivers of ecosystem change and how their impact might evolve in the future.

5. **What indirect drivers underlie these trends?** Identify and evaluate the drivers that are indirectly affecting these trends in the priority ecosystem service. Indirect drivers are factors that contribute to changes in the direct drivers, the company, or other users of ecosystem services. Indirect drivers could be:

- **Governmental** (policies, regulations, subsidies, and incentives)
- **Demographic** (population growth and distribution)
- **Economic** (globalization and markets)
- **Technological** (new technologies)
- **Cultural and religious** (people’s choices about what and how much to consume).

These five questions comprise a simple framework that can give managers a comprehensive understanding of the important trends per priority ecosystem service (Figure 5).

**Gathering input**

Conducting interviews, reviewing existing research, or commissioning original analysis—where significant data gaps exist—are recommended approaches for answering these five questions. Managers can tap into a variety of information sources (see Table 5 on page 12). Box 14 gives examples of data sources used by some road-test companies.
Akzo Nobel reviewed existing research published by academics and nongovernmental organizations. The company also relied on reports prepared by consultants addressing issues such as the economic and environmental trends in the Chinese wood fiber industry and a study on the state of forests and plantations for an Indonesian mill project.

BC Hydro utilized research previously conducted or commissioned by the company regarding trends affecting the watersheds where its dams are located. In addition, the ESR team interviewed a number of leading academics from major Canadian universities and Millennium Ecosystem Assessment scientists who are renowned for their knowledge of the interplay between hydroelectric facilities and ecosystems.

Mondi leveraged existing in-house analyses and external research reports. To complement this input, managers interviewed two to four experts for each of the six ecosystem services Mondi identified as priorities. Interviewees came from a variety of backgrounds, including:

- Forestry consulting firms with an existing working relationship with the company
- Regional universities such as the University of Kwa Zulu Natal
- Regional research institutes such as the Council for Scientific and Industrial Research, the Plant Protection Research Institute, and the Centre for Environment, Agriculture, and Development
- Millennium Ecosystem Assessment scientists with expertise in South African ecosystems
- Nongovernmental organizations.

Syngenta complemented its in-house knowledge by consulting a range of research reports and interviewing relevant experts for each priority service, including:

- Agricultural professionals from the India Agricultural Research Center and the International Rice Research Institute
- Professors from the University of Maryland, Kerala Centre for Development Studies, and the Indian Institute of Technology in Mumbai
- Experts from research institutions, including the International Food Policy Research Institute and the Consultative Group on International Agricultural Research
- Agriculture experts from multilateral organizations including the Food and Agriculture Organization and the World Bank
- Environmental nongovernmental organizations such as the World Wide Fund for Nature-India, the World Conservation Union, and the Ashoka Trust for Research in Ecology and the Environment.
1. Where possible, support answers to these questions with quantitative data. The availability of numeric data varies by ecosystem service, driver, and geography. For instance, quantitative information often exists for provisioning services that have formal markets—crops, livestock, aquaculture, capture fisheries, and timber, among others—or for services that many governments measure and monitor such as freshwater. Qualitative information also may be available for some drivers, such as land use change, climate change, and pollution.

However, quantitative data can be difficult to access or may not even exist for some of the regulating services, cultural services, and drivers. In these situations, using qualitative information and expert advice can be sufficient and yield valuable insights.

While conducting the trends analysis, it is helpful to record relevant findings and to summarize any interviews. It is also helpful to prepare a short paper or presentation for each priority ecosystem service once the analysis has been completed. The summary facilitates sharing results with colleagues and can serve as a helpful reference for later steps in the ESR (Box 15). The Helpful Hints offer other suggestions for conducting step 3.
STEP 4: IDENTIFY BUSINESS RISKS AND OPPORTUNITIES

The fourth step is to evaluate the implications for the company of the trends in the priority ecosystem services. The purpose of this step is to identify the business risks and opportunities that might arise due to these trends.

Types of risks and opportunities

Changes in the quantity or quality of priority ecosystem services can pose five general types of business risks and opportunities: 1) operational, 2) regulatory and legal, 3) reputational, 4) market and product, and 5) financing (Table 6).

1. Operational risks and opportunities relate to the day-to-day activities, expenditures, and processes of the company. Examples of ecosystem service-related risks include:

   • Increased scarcity or cost of inputs. In 2001, water shortages in the U.S. Pacific Northwest impacted the price and availability of two major inputs for Anheuser-Busch, the world’s largest brewer of beer. Barley prices increased in response to reductions in the amount of water available for irrigation. Meanwhile, the availability of aluminum for cans dropped as smelters—which rely on low-cost power from hydroelectric dams—reduced output when electricity prices spiked during the drought.17 Competition for a resource that provides more than one ecosystem service can lead to higher costs as well. For instance, European renewable energy targets are increasing global demand for wood fiber for fuel, which in turn threatens to drive up prices of wood fiber for paper.

   • Reduced output or productivity. Deforestation in the Agno River basin in the Philippines has led to such extensive river and reservoir siltation that the 100-megawatt Binga hydroelectric facility can only operate intermittently.18 Similarly, the productivity of almond, avocado, and melon growers in California has been under threat in recent years as the population of bees—important pollinators—has declined precipitously.19

   • Disruption to business operations. Years of removing wetlands and re-engineering river flows can exacerbate flooding by limiting nature’s ability to absorb excess water.20 These ecosystem changes from the past can pose risks to companies today. A case in point is the 1993 flood of the Mississippi River and its tributaries, the results of which were far-reaching. The Santa Fe Railroad had to close its main route from Chicago to Kansas City for 25 days; Amoco’s oil pipeline to one of its refineries was disrupted when a pumping plant in Illinois became flooded; and Hubinger’s corn processing plant in Iowa shut down for a month because of the high water.21

Examples of ecosystem service-related operational opportunities include:

   • Increased efficiency. The Ingenio El Potrero sugar factory in Mexico invested in a more efficient cooling system that cut freshwater consumption by 94 percent.22 Mitsubishi Semiconductor America, Inc. invested in water-saving technologies that reduced water use by 70 percent and wastewater effluents by 75 percent.23 Both of these investments had two-year paybacks.

   • Low-impact industrial processes. Wetlands are known for their ability to clean water, absorb waste, and breakdown some pollutants. Recognizing this feature, DuPont built a wetland to help treat water coming out of its Victoria, Texas manufacturing plant after the local community started expressing concerns about the deep well injection process the company

had been using. After being routed through an on-site biological treatment facility, wastewater is now released into the wetland for further cleaning before returning to the Guadalupe River.14

2. Regulatory and legal risks and opportunities relate to the laws, government policies, and court actions that can affect corporate performance. Examples of ecosystem service-related risks include:

- **Extraction moratoria.** China imposed a logging ban on forests in the upper reaches of the Yangtze River and the middle and upper reaches of the Yellow River after the devastating 1998 floods. Rampant logging contributed to the disaster by reducing the forest’s ability to control erosion and regulate water flows during heavy rains. The ban had significant implications for forest product companies buying from China.25
- **Lower quotas.** Over the past decade, the European Union has been tightening fishing quotas on cod, hake, plaice, and other species in an effort to curb the depletion of wild fish stocks.26
- **Fine.** In 2008, Union Pacific was fined $102 million for liabilities in a California forest fire. The U.S. District Court found Union Pacific not only responsible for the cost of firefighting and lost timber, but also for the economic damages to soil, wildlife, habitat, and recreational uses.27
- **User fees.** Responding to increased scarcity of freshwater, Mexico’s National Water Commission raised the fee companies pay for water rights 17-fold between 1990 and 1993.28
- **Permit or license suspension.** In 2004, the state government suspended the permit of a Coca-Cola bottling plant in Kerala, India due to concerns over the plant’s impact on local freshwater levels and quality.29
- **Permit denial.** In 2004, the UK government denied Associated British Ports planning permission for a port expansion at Dibden due to its potential encroachment on nearby coastal ecosystems that were valued for their biodiversity and associated cultural services. As a result, Associated British Ports had to write off £45 million it had spent on the proposal and its share price dropped 12 percent the week immediately following the permit denial.30
- **Lawsuit.** In 2003, indigenous Ecuadorians filed suit against ChevronTexaco in an Ecuadorian court, charging the company with dumping toxic oil wastewater into 350 open pits as well as into Amazon-basin wetlands and rivers that the tribes rely upon for drinking, bathing, and fishing.31

Examples of ecosystem service-related regulatory opportunities include:

- **Formal license to expand operations.** In some situations, restoring or protecting an ecosystem can help a business make the case to regulators that it should be allowed to expand activities elsewhere. For instance, International Paper converted more than 2,000 hectares of its land in Georgia into a conservation bank for the endangered red-cockaded woodpecker (*Picoides borealis*), allowing the company to legally expand its operations in other forests of lower conservation value.32
- **New products to meet new regulations.** New regulations to prevent the transport of invasive species via ship ballast water have been set by the International Maritime Organization and will take effect in 2009. Aquatic species transported from one ecosystem to another by ship can have a devastating effect on marine life and local economies. To help ship owners meet the new requirements, Alfa Laval developed and launched PureBallast, a ballast water treatment system that removes unwanted marine organisms without additives or chemicals.33
- **Opportunity to shape government policy.** The tourism industry in Australia benefits from the recreational and ecotourism services provided by the Great Barrier Reef. In 2003, tourism industry associations engaged the Australian government to expand the network of marine sanctuaries within the reef in order to protect and increase the ecosystem’s ability to sustain the industry into the future. Their efforts paid off. In 2004, the government implemented a new zoning plan that expanded the “green zones”—where commercial and recreational fishing are banned—from 5 percent to nearly 33 percent of the reef.34

3. Reputational risks and opportunities relate to the company’s brand, image, or relationship with customers, the general public, and other stakeholders. Examples of ecosystem service-related risks include:

- **Damage to brand or image.** Protests against firms such as Home Depot and B&Q in the 1990s affected their reputation among some customer segments.35 These campaigns were triggered by the impact suppliers of these do-it-yourself chains were having on old-growth forests, a rare ecosystem valued by many people for its rich biodiversity and myriad ecosystem services beyond timber. Similarly, the forestry company MacMillan Bloedel suffered reputational damage when Greenpeace and others protested against the firm for clear-cutting forests. In response to the protests, Scott Paper and Kimberly-Clark in the United Kingdom stopped sourcing from MacMillan Bloedel, causing the latter to quickly lose 5 percent of its revenue.36

"The ESR helped BC Hydro clarify its dependence on several key ecosystem services, an important factor in establishing our long-term goal of No Net Environmental Impact by 2024."

—Ray Stewart, Chief Safety Health and Environment Officer, BC Hydro
• Challenge to social “license to operate.” In 1995, Canadian aluminum manufacturer Alcan sought to divert a river to generate hydropower for one of its smelters. However, local indigenous communities objected since the river was a source of freshwater, fish, and cultural services for them. With little accumulated goodwill with indigenous communities, Alcan was unable to receive consent to operate and ultimately abandoned the project, losing $500 million in up-front investment.37

Examples of ecosystem service-related reputational opportunities include:
• Improved or differentiated brand. Fetzer Vineyards—a division of Brown-Forman, the seventh largest wine manufacturer in the United States—is differentiating its brand in the competitive wine industry by seeking to become the “sustainable” wine producer. For instance, the company uses cover crops to improve erosion control and attract natural predators to manage pests, has a pond to naturally treat winery wastewater, and implements other approaches that leverage services provided by ecosystems—and publicly profiles these practices.38

“The ESR methodology effectively draws on expert advice, stakeholder views, and company strengths to identify and quantify emerging business risks and systematically determines a range of solutions and opportunities.”
—Peter Gardiner, Natural Resources Manager, Mondi

4. Market and product risks and opportunities relate to product and service offerings, customer preferences, and other market factors that can affect corporate performance. Examples of ecosystem service-related risks include:
• Changes in public sector customer preferences. In 2004, the UK government revised its wood procurement policies. Government-purchased timber now has to be legally logged and, where feasible, come from suppliers offering timber from “sustainable” sources. This revision had significant implications for Travis Perkins, the country’s largest supplier of building materials. With nearly 20 percent of its timber sales going to government building projects, the company faced the risk of losing a sizeable share of its business if it failed to meet these new customer preferences.39
Changes in private sector customer preferences. Wal-Mart, the world’s largest retailer, announced in 2005 that it would purchase only farmed shrimp certified to sustainability standards established by the Global Aquaculture Alliance. The company followed up in 2006 by pledging to source all of its wild-caught fresh and frozen fish for North American stores within the next three to five years from fisheries certified by the Marine Stewardship Council. Suppliers of seafood that want to retain Wal-Mart as a customer face significant risks if they fail to meet the company’s new preferences.

Examples of market and product opportunities include:

- **New products or services.** In 2005, AgraQuest Inc. introduced Serenade®, a fungicide that is nontoxic to natural predators and other nontarget organisms. The product helps alleviate human pressure on nature’s pest regulation services. Other products can help customers adapt to scarcity of an ecosystem service such as freshwater. For instance, the British firm Halma manufactures instruments to help water utilities detect leaks in underground water pipes.

- **Markets for certified products.** Markets continue to grow for wood products, seafood, and other goods that are certified as grown and harvested in a manner that sustains an ecosystem’s ability to provide a variety of services. For instance, the global market for wood and paper certified by the Forest Stewardship Council exceeded $5 billion in 2006, a 67 percent increase over three years. The market for Marine Stewardship Council-certified seafood is growing as well. For the year ending March 31, 2007, the global retail value of Marine Stewardship Council-labeled seafood was $509 million, more than double that of the previous year.

- **Markets for ecosystem services.** Companies can be buyers, suppliers, or brokers in markets for ecosystem services that are beginning to emerge in some regions of the world (Box 16). U.S.-based power company AES Corporation, for instance, invested in a 10,000 hectare reforestation project in Brazil in order to generate greenhouse gas emission offsets or credits that it could apply against its own emissions or trade in voluntary or mandatory greenhouse gas emissions trading markets.

U.S. federal law mandates that developers who destroy wetlands must replace them by purchasing credits or shares in wetland mitigation banks—typically located in the same watershed—to offset ecological damage. Recognizing an opportunity, ChevronTexaco received approval in 2005 to convert a tapped-out drilling site in Louisiana into a 2,800-hectare wetland to generate credits for the U.S. wetland mitigation banking market. At an expected market price of $50,000 to $62,000 per hectare, the company could earn more than $150 million selling the credits to developers.

To support these ecosystem service markets, a whole new suite of innovative businesses are emerging, including water traders, mitigation bank developers and brokers, carbon sequestration project developers and brokers, and ecosystem restoration/management consulting firms.
• New revenue streams from company-owned or managed ecosystems. Companies can capture new revenue streams by recognizing that their environmental assets may provide more than one good or service. For instance, Inland Empire Paper Company introduced user fees—$65 per year for families, $40 per year for individuals, $10 for a one day permit—for hikers, mountain bikers, hunters, and others who use its 46,000 hectares of forestlands in Washington and Idaho, essentially creating a revenue stream from the forest’s recreational services.48

5. Financing risks and opportunities relate to the cost and availability of capital from investors. Operational, regulatory, reputational, and/or market risks (and opportunities) can impact a company’s cash flows, which in turn can affect its credit quality. As a result, a business may face a higher cost of capital or more rigorous lending requirements as the financial sector becomes more attuned to the implications of ecosystem degradation for borrowers or clients. Alternatively, managers may find some lenders and socially responsible investment funds becoming more interested in investing in their companies. For example:

• In 2011, the World Bank Board approved new International Finance Corporation (IFC) performance standards that screen for ecosystem service risks and impacts. This indicates that the IFC will no longer support projects that significantly degrade ecosystem services.49

• Dutch-based ABN AMRO has committed to avoid financing projects or operations that extract resources from virgin or high-conservation-value forests.50 High-conservation-value forests provide myriad ecosystem services, including watershed protection, carbon sequestration, recreation, and ethical value—they host a wealth of biodiversity.

• Global investment banks such as Citigroup are beginning to assess the degree to which large listed companies are exposed to risks and opportunities associated with freshwater scarcity and quality. Sectors that rely on water as an input into production processes or that release wastewater as an output are coming under greater scrutiny by banks. On the other hand, companies that provide solutions for water supply, treatment, and demand management are gaining more investment attention.51

• Goldman Sachs has expressed interest in investment opportunities in markets for water, biodiversity, and forest-based ecosystems.52

Note that these five types of risks and opportunities are not mutually exclusive; one type can feed another. A regulatory risk, for instance, could translate into a financing risk; a company on the verge of facing new regulations might find its bank implementing tighter lending policies. A reputational risk could evolve into a market risk; a company experiencing reputational damage might find some of its customers changing their buying patterns.

Process for identifying risks and opportunities

There are many ways to identify possible business risks and opportunities arising from trends in a company’s priority ecosystem services. One method that proved useful to ESR road-test companies was to begin by holding a structured brainstorming session. Start by summarizing the company’s dependence and impact on one of its priority ecosystem services (step 2) and then briefly review the trends in that service (step 3). All of the relevant facts will therefore be fresh in the minds of the session’s participants. Armed with this information, participants proceed to brainstorm possible business risks and opportunities these trends might pose for the company. To help trigger ideas, managers could consider each type of risk and opportunity outlined in Table 6 (see page 24).

Once completed, managers move on to the next priority ecosystem service and go through the same process, continuing until all priority services have been covered. The brainstorming exercise might span more than one meeting.

Desk research can supplement the results of the brainstorming session. Questions to consider that might uncover additional risks and opportunities include:

• What risks and/or opportunities have other businesses in the company’s industry faced due to these ecosystem service trends?

• What risks and/or opportunities have these trends posed to other businesses outside the company’s industry?

The end product of step 4 of the ESR is a list of risks and opportunities the company might face due to trends in priority ecosystem services. Managers can identify risks and opportunities per priority ecosystem service (Table 7) or per type of risk and opportunity (Table 8). The Helpful Hints provide other suggestions for step 4.

HELPFUL HINTS Step 4

• Manage the brainstorming session so that one person does not dominate the discussion and idea generation.

• To increase the likelihood of novel ideas being considered, include one or more outside experts or representatives of nongovernmental organizations during the brainstorming session.

• Look for opportunities to provide new products/services that help others either mitigate their impact on ecosystems or adapt to declining ecosystem services.

• Be sure to consider government policy not only as a source of business risk but also a potential opportunity to gain competitive advantage or “level the playing field.”

• If the company has internal expertise in certain aspects of ecosystems, consider providing for-profit consulting services to other firms.

• Look for ways to monetize ecosystem services the company already provides without compensation.

• Find opportunities to build on corporate initiatives already under way.

• After brainstorming risks and opportunities per priority ecosystem service, identify risks and opportunities that might arise due to the interplay between services.

An additional activity is necessary for managers who chose a supplier or customer as the scope of the ESR. For these managers, all of the research and the risks and opportunities identified up to this point have been with respect to the selected supplier or customer. These findings will need to be converted into risks and opportunities for the business conducting the ESR, as Syngenta did during its road test (Box 17).

**Box 17 Translating Customer Risks into Business Risks and Opportunities**

**Syngenta** chose one of its customer segments, farmers in southern India, as the scope for its road test. The ESR identified a number of risks to farmers in this region arising from the degradation of several ecosystem services. Risks included:

- Reduced availability and quality of freshwater for irrigation
- Loss of topsoil due to clearance of native vegetation, failure to implement erosion control measures, and other poor farming practices
- Potential loss in yields of some fruits, vegetables, and spices due to a decline in the number of pollinators
- Lower yields due to a decline in the ability of natural predators to contain pest outbreaks
- Reduced soil fertility due to poor management practices.

These risks indirectly affect Syngenta by threatening to reduce the number of viable farmers in the region and by shifting crop preferences, thereby requiring the company to adapt its seeds or crop protection products. At the same time, the company identified a number of possible opportunities to help farmers either reduce their impacts on ecosystems or adapt to ecosystem change. Examples include:

- Based on the company’s experience in other regions (e.g., Operation Bumblebee in the United Kingdom), lead an initiative to increase pollinators in the region through selling natural seed mixes, selling bees, or offering assistance through extension services
- Use the company’s in-depth knowledge of plants to offer farmers an improved integrated pest management system
- Develop and offer seeds and crop protection products that use less water, have better built-in resistance to disease and pests, and are more tolerant of dry or salty soils, among other traits
- Strengthen the company’s approach to the market and its training services to offer farmers best management practices that restore natural ecosystem functions
- Engage the company’s foundation and external research institutions to fill gaps in information about the status and trends in ecosystem services critical to agriculture in the region.

**STEP 5: DEVELOP STRATEGIES FOR ADDRESSING RISKS AND OPPORTUNITIES**

The fifth step is to develop and prioritize strategies for minimizing the risks and maximizing the opportunities identified during step 4. Once the fifth step has been completed, managers will have a prioritized set of strategies to implement, which in some cases can be a good time to undertake corporate ecosystem valuation.

**Categories of strategies**

Strategies for responding to ecosystem service-related risk and opportunities fall into three broad categories (Figure 6):

1. **Internal changes.** Companies can address many of the risks and opportunities listed in Table 6 (see page 24) through changes in operations, product/market strategies, and other internal activities. Potlatch, for instance, developed a strategy to establish a new revenue stream from its forests through visitor user fees. Unilever reduced its exposure to declining cod stocks in part by switching to other—albeit less profitable—species. Examples of other internal changes include increasing the efficiency of using ecosystem-based resources, launching new products or services, supplying or buying sustainably certified products, and reducing the impact of corporate operations on ecosystems to avoid regulatory risks.

2. **Sector or stakeholder engagement.** Companies can also address some of these risks and opportunities by partnering with industry peers, collaborating with other sectors, or structuring transactions with stakeholders. Vittel, for instance, addressed its water contamination problem (see Chapter I) by paying farmers in the watershed to switch to more sustainable land use practices and restoring the ecosystems surrounding the springs. The strategy worked; water purity returned and Vittel is now one of Nestlé Waters’ top selling brands. As an additional response to its fish supply crisis, Unilever collaborated with the World Wide Fund for Nature and
a range of stakeholders to create the Marine Stewardship Council.55 Energia Global made payments to a forest protection fund that paid landowners upstream of its dams to conserve or re-establish tree cover, thereby reducing siltation of the rivers.56

3. Policy-maker engagement. Not all ecosystem service-related risks and opportunities can be successfully addressed through internal corporate activities alone or through sector and stakeholder engagement. Some require changes in government policy. Many ecosystems providing services valued by a company are controlled by governments. Others stretch across numerous private owners, making engagement inefficient or nearly impossible. Moreover, poor public policies are often a key indirect driver of the degradation of ecosystem services. Therefore, a productive corporate strategy for addressing some ecosystem service-related issues can be to engage policy-makers and government agencies to establish good policies. Companies can voice support for (or provide input to) incentives or effective rules for sustainable management of ecosystem services. In 2007, for instance, leaders of six multinational companies—The Coca-Cola Company, Levi Strauss & Co., Läckeby Water Group, Nestlé S.A., SABMiller, and Suez—pledged to work with governments and policy-makers to address pressing issues regarding freshwater availability and quality.57

Box 18 highlights some of the strategies identified by one of the road-test companies.

Identifying and prioritizing strategies

Each company has its own specific processes for developing and prioritizing strategies to address identified business risks and opportunities. This publication does not attempt to reinvent these approaches. Rather, ESR road-test experience suggests that the following activities can complement existing processes:

- Brainstorm and discuss possible strategies for addressing each of the ecosystem service-based risks and opportunities identified in step 4. This exercise can immediately follow the brainstorming session conducted for step 4, while the issues are fresh in the minds of participating managers. Several road-test companies took this approach. Or the session could occur at a later date, when managers themselves may be more refreshed.
- Involving in the brainstorming session the team that conducted the ESR, the business manager(s) who may be responsible for implementing the strategies, and representatives from corporate government relations.
- Follow up the exercise with research to provide more detail on the candidate strategies. For example, if a strategy involves developing new revenue streams from a company-owned ecosystem, then managers may want to conduct an ecosystem service economic valuation study (see Box 19). If the strategy involves working with national policy-makers to create incentives for more sustainable management of selected ecosystem services, then managers may want to research possible policy options and determine which policy-makers to approach.
- Look at other companies facing similar ecosystem service-based risks and opportunities to help trigger additional ideas. Identify the strategies they are implementing to address these issues.
NEXT STEPS

The ESR concludes with the identification and prioritization of strategies to address ecosystem service risks and opportunities. But what comes after these strategies have been advanced?

Building on the experience of implementing an ESR in one part of the company, managers can extend the methodology to additional divisions, markets, customers, suppliers, or other aspects of their business. Managers can also incorporate the ESR—or elements of it—into their existing environmental management and due diligence systems or into their corporate strategy development processes in order to augment them.

In both cases, the ESR is a promising approach for companies to strengthen their ability to respond to a growing global environmental crisis. By accounting more fully for the dependence and impact of their business on ecosystem services, managers can better address the associated risks and opportunities. In addition, by helping companies make the connection between healthy ecosystems and the bottom line, the ESR can stimulate more sustainable business practices and support for public policies that protect and restore the ecosystems upon which we all depend. One thing is abundantly clear: “business as usual” is no longer an option.

Box 19 Step 5 and Corporate Ecosystem Valuation

Ecosystem valuation assigns quantitative values to ecosystem services such as carbon sequestration, recreation, and watershed protection, in order to improve decision-making. Conducting an ecosystem valuation may be a particularly useful activity for some companies during, or as a result of, step 5 of the ESR (strategy development).

WBCSD’s Guide to Corporate Ecosystem Valuation is a useful framework for conducting an ecosystem valuation study in step 5 of the ESR. The guide is a framework to help managers make better-informed business decisions by explicitly valuing both the costs of ecosystem degradation and the benefits received from ecosystem services. It has five steps:

1. Scoping
   - This stage helps a company define the scope for the valuation exercise, using a checklist of questions. Only brief responses are required, and the process may involve numerous iterations.

2. Planning
   - This stage develops a suitable plan to undertake the valuation effectively. The plan should be more specific in terms of detail as compared to stage 1.

3. Valuation
   - This stage involves the actual valuation, which may be qualitative, quantitative and/or monetary. It begins by fully defining the company aspect to be valued, and ends by subjecting the results to a sensitivity analysis.

4. Application
   - This stage involves companies using and communicating the valuation results to influence internal and external decision-making.

5. Embedding
   - The final stage is to embed the CEV approach within company processes and procedures.

The Guide to Corporate Ecosystem Valuation can inform a number of business purposes, such as communicating the value of ecosystem services, comparing the costs and benefits of an investment in ecosystem restoration or protection, and identifying possible market values or revenue streams from an ecosystem service. Some companies have also used the guide to measure the societal value of ecosystem services in order to engage stakeholders and policymakers.

The ESR website (www.wri.org/ecosystems/esr) provides a number of tools and resources to help business managers, analysts, and consultants conduct a Corporate Ecosystem Services Review. Some key resources are listed below as well.

**ESR tools**
Managers can download materials and tools designed specifically for the ESR, including:
- An electronic version of these guidelines in pdf format available in English, French, Spanish, Portuguese, Chinese, and Japanese
- A spreadsheet containing the *Dependence and Impact Assessment Tool* (see Box 10 on page 17 for details about the tool) available in English, French, Spanish, Chinese, and Japanese
- Short presentations to communicate the business case for an ESR, explain the five steps of the process, and build support for conducting a review
- Case studies on how companies are using the ESR and are responding to business risks and opportunities arising from their dependence and impact on ecosystems
- Other internet-based options for sharing ESR experiences and for obtaining answers to questions about the ESR
- ESR training materials including videos, step-by-step PowerPoint presentations and exercises, and detailed ESR case studies.

**Scientific assessments**
The website includes profiles and links to several scientific assessments that can be helpful when conducting the ecosystem service trends analysis (step 3), including:
- The Millennium Ecosystem Assessment, which provides a state-of-the-art scientific audit of the condition and trends in the world's ecosystems and ecosystem services, as well as a review of the drivers of ecosystem change
- Reports of the Intergovernmental Panel on Climate Change, which provide the latest scientific and technical assessments of human-induced climate change, including its observed and projected impacts on the world's ecosystems and ecosystem services such as freshwater
- The Intergovernmental science-policy Platform on Biodiversity and Ecosystem Services (IPBES) is designed to be an interface between the scientific community and policy makers, and aims to build capacity for and strengthen the use of science in policy making. Like the IPCC, IPBES assessments could also be very valuable to business.

**Economic valuation**
The website includes information and links regarding economic valuation of ecosystem services, including:
- The *Guide to Corporate Ecosystem Valuation*, a process to help managers make better-informed business decisions by explicitly valuing both the costs of ecosystem degradation and the benefits received from ecosystem services.
- The *Economics of Ecosystems and Biodiversity Report for Business* is designed to draw attention to the global economic benefits of biodiversity and ecosystem services, to highlight the growing costs of biodiversity loss and ecosystem degradation, and to draw together expertise from the fields of science, economics, and policy.
- Other ecosystem service valuation tools can sometimes be used to help quantify the physical quantity and quality of ecosystem services, their location, and their economic value. Tools—including InVEST, ARIES, ATEAM, EcoMetrix, and the Ecosystem Portfolio Model, among others—are continually being tested and refined. Managers should be sure to understand the assumptions underlying the models they use and check results against the company's specific circumstances.
Issue-specific tools

The website includes descriptions and links to a number of tools and resources that may assist with in-depth analysis of particular ecosystem services, drivers of ecosystem change, or business strategies to manage risks and opportunities. The website provides guidance on when these tools may be most relevant in the ESR process.

The website also includes guidance on incorporating ecosystem services into business performance systems, such as:

- *Nature in Performance* (2012), a WRI report that provides initial guidance on how to incorporate ecosystem services into corporate environmental management, reporting, and due diligence systems.
- The Global Reporting Initiative’s *Approach for Reporting on Ecosystem Services* (2011), which provides guidance on incorporating ecosystem services into an organization’s performance disclosure.

Sector-specific tools

The website also provides an overview and links to tools and resources that may help companies in particular industries assess their dependence and impact on ecosystems, business risks and opportunities, and strategies for managing them. It identifies the ESR steps where these tools may provide the most assistance.

The resources website will be updated as new support tools become available.

Professional networks

There are also several professional networks focusing on business and ecosystem services that connect managers, consultants, and ecosystem experts to share lessons learned and promote collaboration. For example:

- The Ecosystem Services Experts Directory includes a wide range of noted experts on ecosystems and ecosystem function willing to provide specific guidance on particular ecosystem trends or environmental management practices.
Notes

6 For more information about the Millennium Ecosystem Assessment, see www.maweb.org.

8 The other ecosystem service rated as “enhanced” is global climate regulation (carbon sequestration). According to the Millennium Ecosystem Assessment, forests and soils were a net source of carbon dioxide (CO₂) emissions over the past two centuries. Approximately 40 percent of CO₂ emissions came from land use change, primarily through deforestation, while terrestrial ecosystems absorbed approximately only a third of all CO₂ emissions during that time period. During the 1980s and 1990s, however, terrestrial ecosystems were a net CO₂ sink. They were the source of about 20 percent of CO₂ emissions—fossil fuels accounted for the rest—but absorbed approximately a third of total CO₂ emissions during that time period. Therefore, the ability of ecosystems to sequester carbon in the 1980s and 1990s was “enhanced” relative to the past two centuries. Nevertheless, deforestation is still a major source of man-made CO₂ emissions and efforts to curb deforestation would help reduce greenhouse gas concentrations in the atmosphere. Source: Millennium Ecosystem Assessment. 2005. *Ecosystems and Human Wellbeing: Current State and Trends.* Washington, DC: Island Press.

15 Dead zones are vast regions of oxygen-depleted waters that stress aquatic ecosystems. Dead zones can lead to fish kills, ecosystem collapse, and economic damage to shellfish, recreational fishing, and other industries.

ABOUT WORLD RESOURCES INSTITUTE
The World Resources Institute (WRI) is an environmental think tank that goes beyond research to create practical ways to protect the Earth and improve people's lives. Our mission is to move human society to live in ways that protect Earth's environment for current and future generations. Our program meets global challenges by using knowledge to catalyze public and private action to:

• Reverse damage to ecosystems. We protect the capacity of ecosystems to sustain life and prosperity.
• Expand participation in environmental decisions. We collaborate with partners worldwide to increase people's access to information and influence over decisions about natural resources.
• Avert dangerous climate change. We promote public and private action to ensure a safe climate and sound world economy.
• Increase prosperity while improving the environment. We engage the private sector to grow while improving environmental and community well-being.

ABOUT WORLD BUSINESS COUNCIL FOR SUSTAINABLE DEVELOPMENT
The World Business Council for Sustainable Development is a CEO-led organization of forward-thinking companies that galvanizes the global business community to create a sustainable future for business, society and the environment. Together with its members, the council applies its respected thought leadership and effective advocacy to generate constructive solutions and take shared action. Leveraging its strong relationships with stakeholders as the leading advocate for business, the council helps drive debate and policy change in favor of sustainable development solutions.

The WBCSD provides a forum for its 200 member companies - who represent all business sectors, all continents and a combined revenue of more than $7 trillion - to share best practices on sustainable development issues and to develop innovative tools that change the status quo. The Council also benefits from a network of 60 national and regional business councils and partner organizations, a majority of which are based in developing countries.

ABOUT MERIDIAN INSTITUTE
The Meridian Institute helps decision-makers and diverse stakeholders solve some of society’s most contentious public policy issues. Meridian works with all involved parties to create the right conditions for creative, practical solutions, and mutually beneficial agreements that can be effectively implemented. Meridian’s experience encompasses environment, natural resources, agriculture, sustainability, science and technology, and security. We work at the local, national, and international levels.
